TOP 3 LATEST DATA MANAGEMENT TRENDS IN 2021

The fintech industry is buried with data with challenges such as increasing privacy and safety concerns. Most of the predictions for 2021 fintech industry that we see are centered around dealing with these challenges.

Here are **3** of the most important predictions based on our observations and research with our customer base and industry partners.

1

Streaming data will become an indispensable part of business processes

In order to take advantage of available data to manage and make faster decisions for all parts of the business, companies must combine streaming data directly with reporting and analytics systems to ensure a prompt review.

2

IT strategies will center on Data-driven automation for AIOps

Companies are analyzing new use cases relating to machine learning and Artificial Intelligence (AI). They will see the benefits in AIOps use cases such as detecting security defaults, detecting fraud, and watching for potential performance problems before they occur.

3

New tools will be needed to monitor cloud computing performance

In 2021, workload optimisation tools will offer businesses a complete, end-to-end prospect of their business service and componentry to provide a competitive edge.
